

SUSTAINABILITY

at

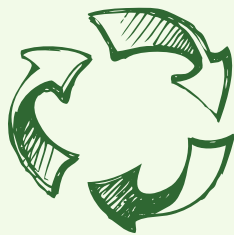

IREMA-Filter takes up the challenge and does not only supply energy-efficient filtration products but also takes care of the environment within the manufacturing process. Using internal and external recycling options and having switched to 100% green electricity, we make a major contribution to achieve our sustainability goals.

100% green power

Energy consumption was changed to 100% green power from renewable energy sources including wind and hydro power.

Savings*: 2000 tons CO²

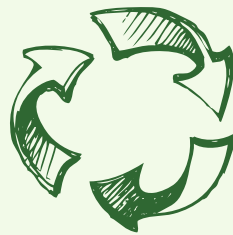

* savings in 2022

Internal recycling

PP waste materials are converted internally into granules and returned to our own filter media production.

Savings*: > 250 tons PP

* savings in logistic / material in 2022

External recycling

Beside internal recycling, all remaining PP waste will be recycled externally. PP scrap is sent to injection moulding companies for recycling.

Production including recycling processes
